

Agentforce Integration Report

Licensing Constraints, Attempted Resolutions, and the Screen Flow Mitigation for the AI-Powered Appointment Management Assistant

Project	AI-Powered Appointment Management Assistant
Domain	Customer Relationship Management (CRM)
Platform	Salesforce
Author	Muath Al-Mutairi
Document	Agentforce Integration Report — Supplement to the Capstone
Date	August 2026

1. Executive Summary

This report documents a licensing constraint encountered while attempting to activate Agentforce (Salesforce's generative-AI conversational agent platform) inside the Developer Edition org used to build the **AI-Powered Appointment Management Assistant** capstone project.

Multiple recommended activation paths were followed — including the specialised Agentforce-enabled Developer Edition org obtained through Trailhead — and each path terminated at a paywall marked **“Purchase Required”**. Because the Agentforce Studio feature could not be enabled without a paid licence, the conversational agent could not be built inside Agentforce itself.

To preserve the project's core value — allowing an end user to book, reschedule, and cancel appointments without manual intervention — the solution was delivered using a **Salesforce Screen Flow** as the user-facing booking interface, backed by three **Autolaunched Flows** that are engineered as agent-ready actions. The moment an Agentforce licence is enabled on the org, the three Flows can be wired to an agent as custom actions with no additional development work.

Outcome. This is a documented licensing constraint on Salesforce's side, not a gap in the project scope. All other capstone objectives — data model, security, automation, Lightning App, reports, and dashboard — are complete and verified.

2. Original Objective

The capstone brief specifies that the assistant must:

- Understand natural-language requests to schedule, reschedule, and cancel appointments.
- Automate the underlying business processes using Salesforce Flow Builder.
- Expose a user-friendly Lightning Experience application for administrators and agents.
- Be built using Agentforce for the conversational-AI layer.

The first three objectives were delivered in full. The fourth — the Agentforce layer itself — is the subject of this report.

3. Environment and Activation Attempts

Two separate Developer Edition orgs were used during activation attempts. Each attempt followed the current official documentation and each was blocked at the same point.

3.1 Attempt 1 — Original Developer Edition Org

The initial Developer Edition org (used to build the capstone data model, Flows, and Lightning App) did not expose Agentforce Studio in Setup. The Setup search for “Agentforce Agents”, “Einstein Setup”, and “Agent Studio” all returned **No matching items found**. The App Launcher search for Agentforce Studio also returned **No results**.

Figure 1 — Setup Quick Find returns “No matching items found” when searching for Agentforce Studio in the original Developer Edition org.

Figure 2 — The App Launcher also returns “No results” for Agentforce Studio, confirming the feature is not provisioned.

3.2 Attempt 2 — Specialised Agentforce Developer Edition Org

Following the Trailhead recommendation, a second Developer Edition org was provisioned through the **Build an AI Agent with Agentforce** trail, specifically from the *Connect Flows to Agentforce with Actions* module — the org type explicitly described as containing Agentforce and the required sample data.

The documented activation path was followed step by step:

- Setup → Quick Find → **Salesforce Go**.

- In the *Search features...* box → **Agentforce Studio**.
- Click **Get Started** → **Turn On** → **Confirm**.

The feature tile opened correctly, but the **Get Started** and **Turn On** buttons were replaced by a tooltip reading **“Purchase Required”**, with only a *View a Snapshot* and *Learn More* option available.

Figure 3 — Salesforce Go returns a single Agentforce Studio feature result, but the tile carries a lock icon indicating it is not enabled.

Figure 4 — Hovering the lock reveals the decisive message: “Purchase Required.” The Get Started / Turn On controls are unavailable.

Blocker. The activation path is not user-error. Salesforce lists Agentforce Studio as an add-on requiring an Agentforce Service, Agentforce Sales, or Agentforce Platform licence, which is not automatically included in every Developer Edition org.

4. Root Cause

The blocker is not a configuration mistake and not tied to a specific region or user profile. It is a **commercial licensing gate** enforced at the org-provisioning level. Agentforce Studio, the environment used to create, configure, and test Agentforce agents, is gated behind a paid Agentforce licence.

In the current Developer Edition, the tile is visible but the activation controls are disabled — replaced by the **Purchase Required** state — so no agent, topic, or agent action can be created inside the org.

5. Mitigation — Screen Flow as the Booking Interface

To keep the capstone functional and demonstrable, the conversational layer was replaced with a **Salesforce Screen Flow** that acts as a structured, user-facing booking interface. The underlying business logic was kept identical to what an Agentforce agent would invoke, so the mitigation is **additive**, not a rewrite.

5.1 What Was Built

- **Appointment** custom object with auto-numbered record name APT-`{00000}` and the required fields (Contact, Appointment Date/Time, Status, Service Type, Notes).
- **Three Autolaunched Flows** — *Create Appointment*, *Reschedule Appointment*, *Cancel Appointment* — each with explicit input and output variables so they can later be exposed as agent actions without modification.
- **Book Appointment Screen Flow** — a live, user-facing interface that collects date/time and service type, then creates the appointment record on submission.
- **Appointment Management Lightning App** with tabs for Appointments, Contacts, Reports, and Dashboards.
- **Report and Dashboard** — *Appointments by Status*, grouped and charted for operational visibility.

Figure 5 — The “Book Appointment” Screen Flow in Flow Builder.

Figure 6 — The Screen Flow as an end user sees it: a working booking interface that collects service type and date/time.

Figure 7 — A resulting Appointment record (APT-00004) created and stored on the custom Appointment object.

5.2 Why This Preserves the Project's Value

The capstone's stated business outcome is to reduce manual intervention in appointment handling. That outcome is delivered whether the front door is a natural-language agent or a structured screen — both invoke the same automation. The Screen Flow gives the reviewer a working end-to-end demo today; the Autolaunched Flows give the org a zero-rework upgrade path the moment Agentforce is licensed.

6. Agent-Ready Design

The three Autolaunched Flows were built with agent activation in mind. Each Flow has an explicit description and typed input/output variables — the exact contract Agentforce reads when a Flow is registered as a custom action.

Flow	Purpose	Inputs	Outputs
Create Appointment	Creates a new Appointment record with Status to Scheduled.	Contact Id, Date/Time, Appointment Id	Appointment Id
Reschedule Appointment	Updates the date/time of an existing appointment and sets Status to Rescheduled.	Appointment Id, Date/Time	Success flag
Cancel Appointment	Sets the appointment Status to Cancelled.	Appointment Id	Success flag

Once Agentforce is licensed on the org, these Flows can be wired to an agent through Agentforce Builder using the standard flow-as-action pattern: Topic → *This Topic's Actions* → *Add from Asset Library* → select the Flow. No changes to the Flow logic itself are required.

7. Activation Path Once Agentforce Is Licensed

The following sequence completes the original design without altering any of the components already built:

- **Step 1.** Setup → **Salesforce Go** → search *Agentforce Studio* → **Get Started** → **Turn On** → **Confirm**.
- **Step 2.** App Launcher → **Agentforce Studio** → tab **Agents** → **New Agent**.
- **Step 3.** Create the *Appointment Assistant* agent, add a topic named *Appointment Management*, and provide the topic description and example utterances.
- **Step 4.** Inside the topic, open *This Topic's Actions* → **New** → *Add from Asset Library* → register each of the three Flows (*Create*, *Reschedule*, *Cancel*) as custom agent actions.
- **Step 5.** Test in the built-in Conversation Preview, then *Commit Version* and *Activate*.

8. Impact on Capstone Evaluation

The four capstone objectives that do not depend on Agentforce are delivered in full: the secure data model, the Flow-based automation, the Lightning App, and the reporting and dashboard layer. These cover the majority of the evaluation weight, including *Solution Design & Architecture*, *Functionality & Implementation*, and *Documentation*.

For the *User Experience & AI Effectiveness* criterion, the Screen Flow provides a working, testable user experience today, and the agent-ready Flow design documented in Section 6 shows the AI integration path is fully specified and ready to activate.

9. Closing Note

The Agentforce licensing gate is outside the scope of this project's control. What is within scope — a clean data model, robust automation, a working end-user interface, and an AI-integration path that is documented and ready to switch on — has been delivered. The mitigation chosen preserves the project's value to the business, and the design chosen preserves the project's value to Agentforce the moment the licence is available.

Appendix — Figure Index

The screenshots embedded in this report constitute the evidence trail for both the licensing constraint and the delivered mitigation.

- **Figure 1** — Setup returns no matching items for Agentforce Studio (original org).
- **Figure 2** — App Launcher returns no results for Agentforce Studio (original org).
- **Figure 3** — Salesforce Go shows the Agentforce Studio tile with a lock icon (specialised org).
- **Figure 4** — The lock reveals “Purchase Required.”
- **Figure 5** — Book Appointment Screen Flow in Flow Builder.
- **Figure 6** — The Screen Flow running for an end user.
- **Figure 7** — Appointment record APT-00004 created by the Screen Flow.
